

Dongqian Lake Cultural Hall

Dongqian Lake is associated with the mythology of Fan Li and Xi Shi. It is a cultural wasteland. As a tourist destination, the picturesque place lacks cultural structures, thus the exhibition hall and theater are created at the base to serve guests. At the same time, the public space formed by the two may be used for activities in adjacent communities. Both structures were created in accordance with the mountain and fell layer by layer. Under the same operating approach, one adopts the light flying trend and the other imitates the goal of riprap in the mountains, creating a contrast and correlation that results in a harmonious architectural cluster.

Base analysis and site selection

Choose the hillside on the west side of the hamlet, walk the road to the God of Wealth temple on the other side of the hillside.

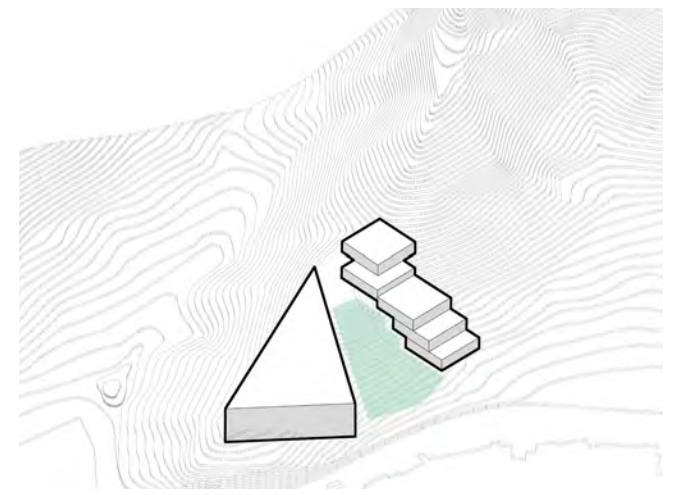

Generate building blocks

Form the blocks of the theater and exhibition hall, which are perpendicular to each other to enclose the public space.

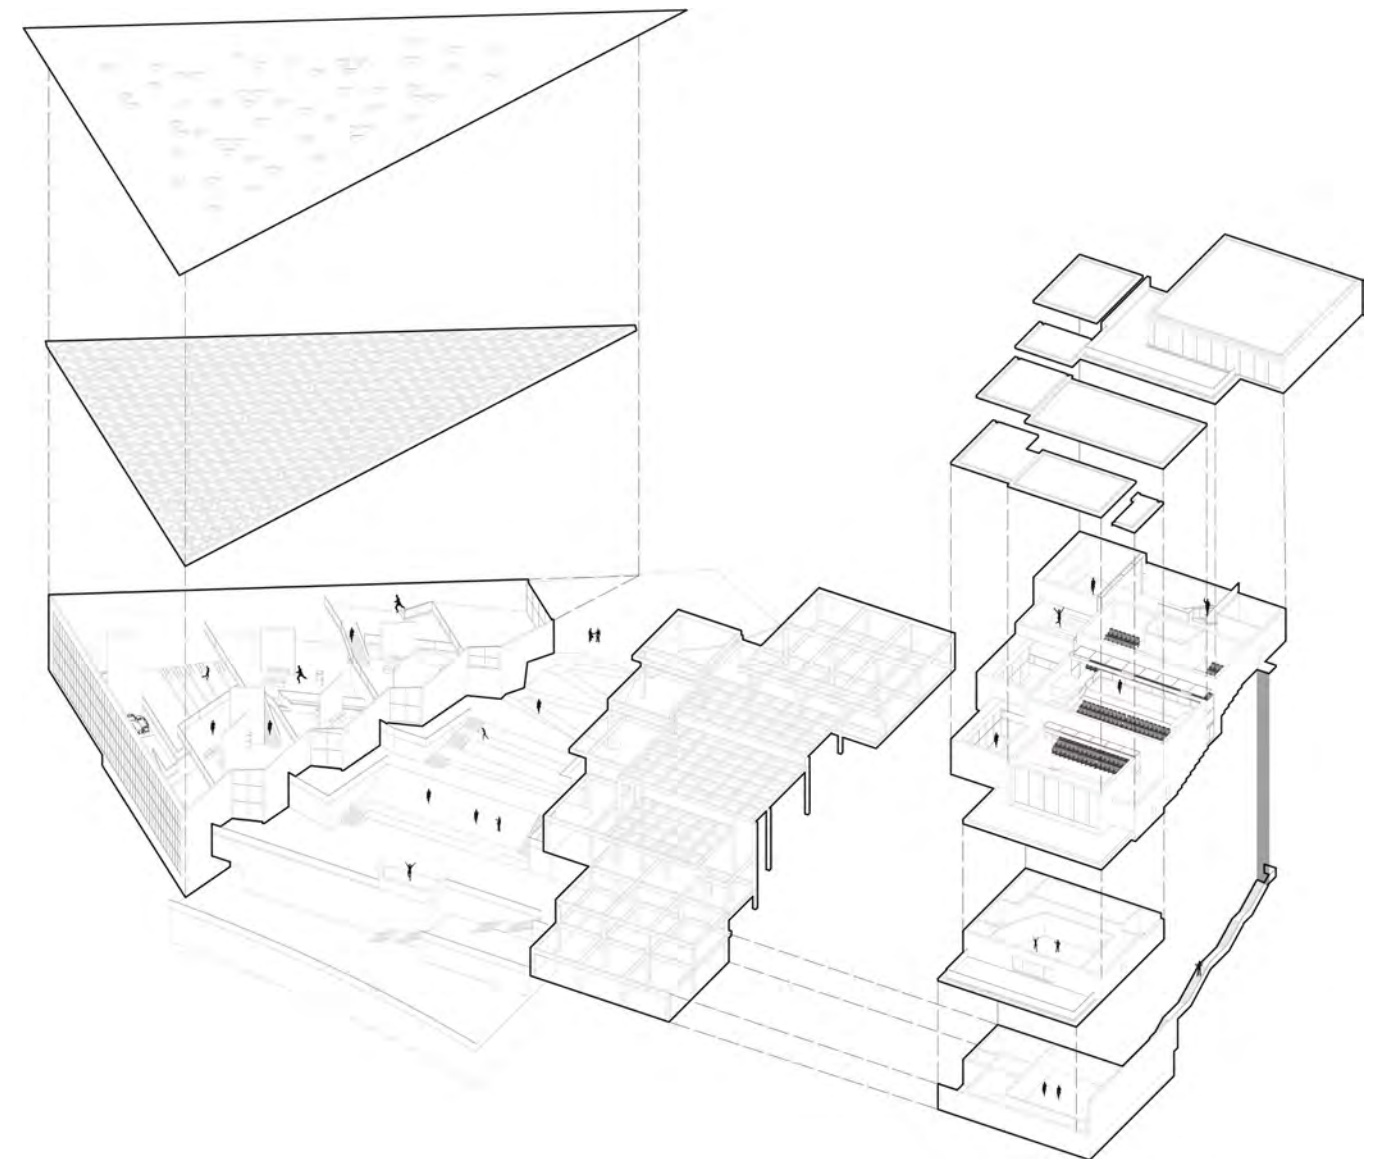

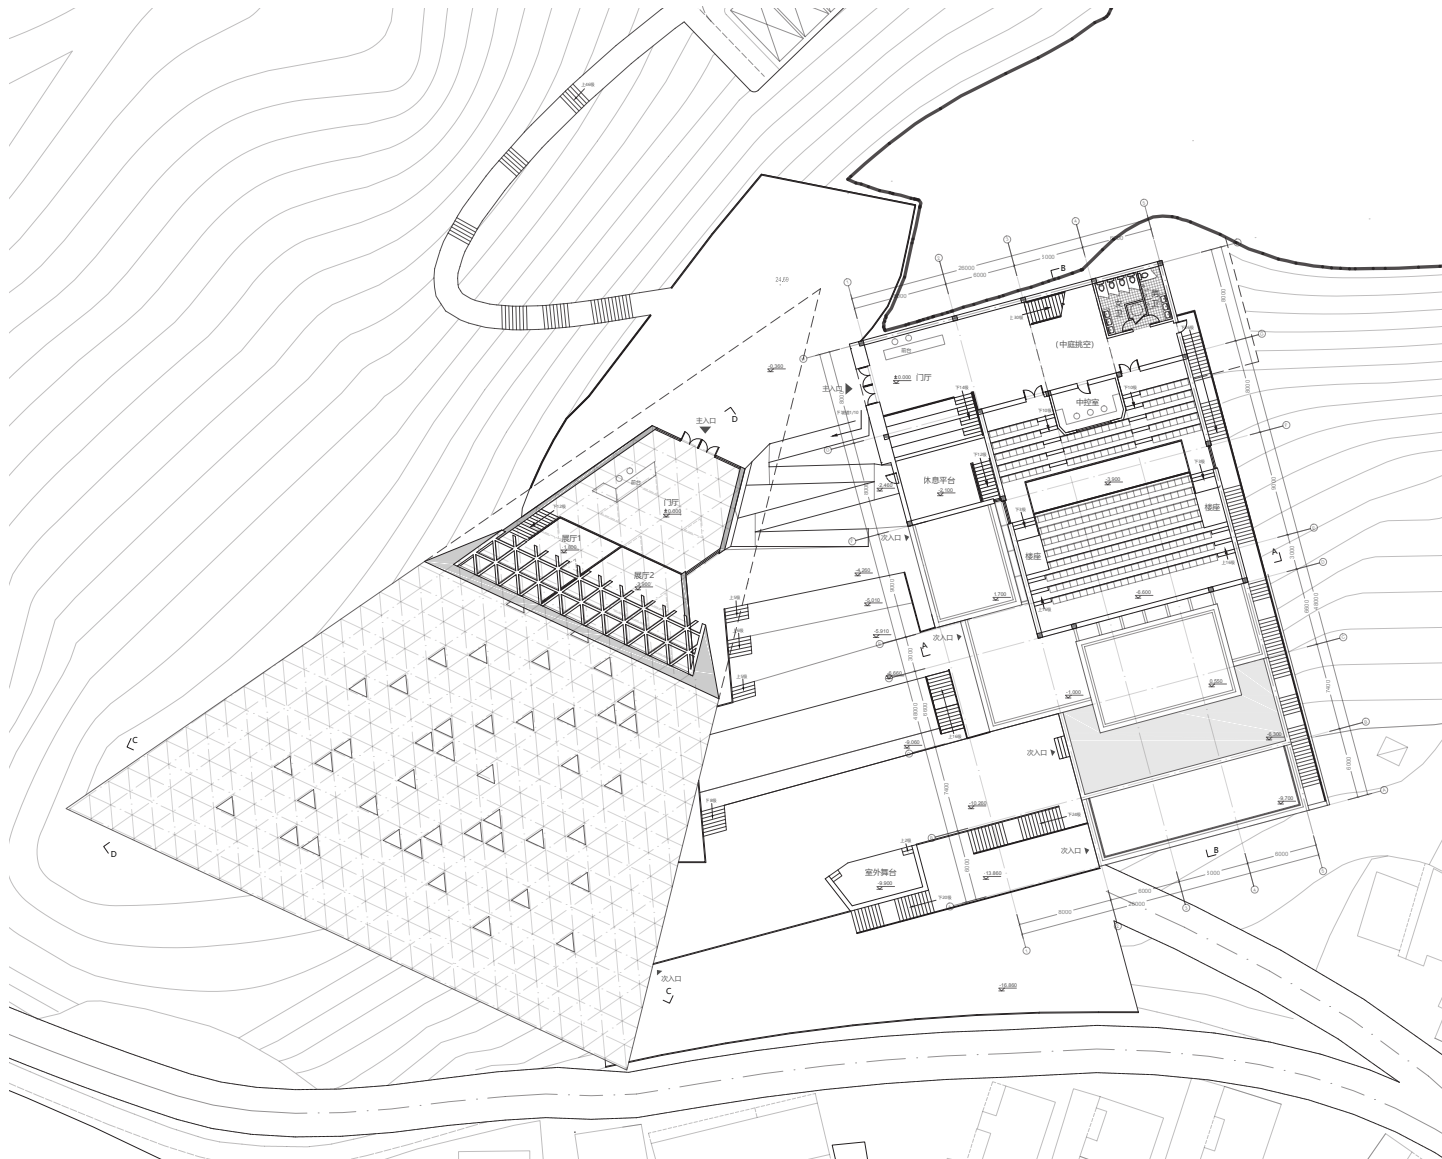

Rotating building block

Adjust the angle between the two buildings such that the cluster has a fan-shaped square.

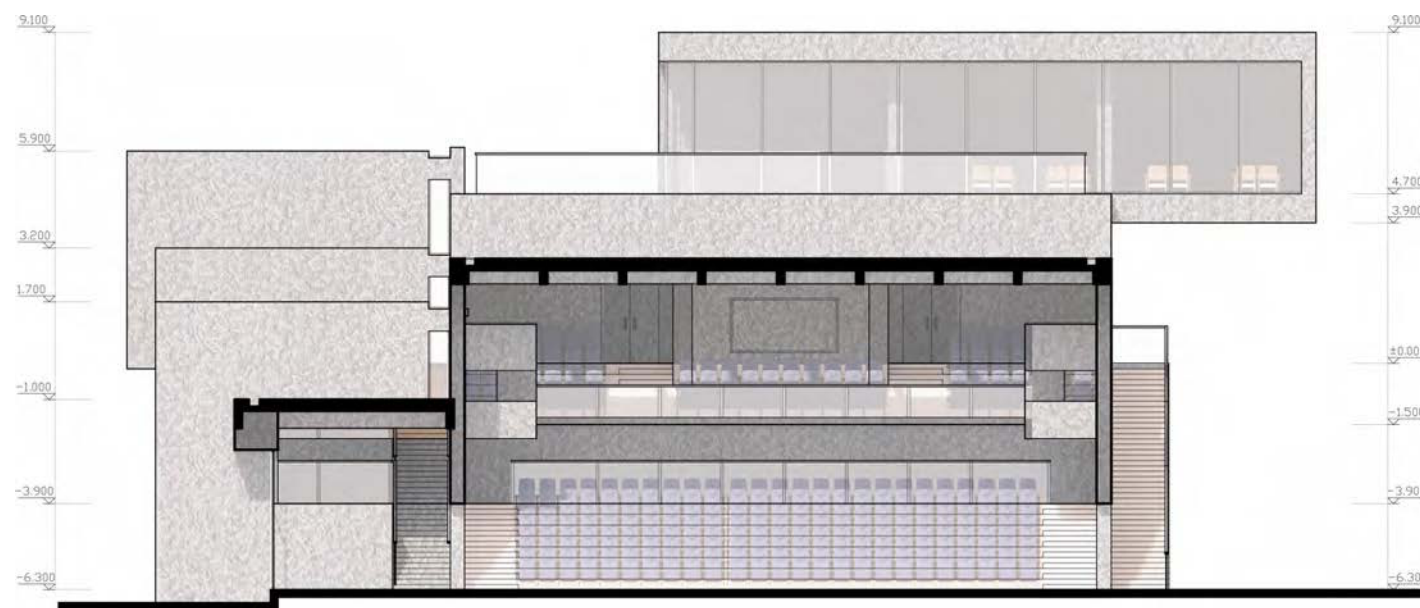

Cutting building blocks

"Falling" notion. The theater visibly represents the concept, while the exhibition hall inwardly embraces the notion.

The theater

The motif of "dropping rocks" portrays the impression of volume of the structure from the outside.

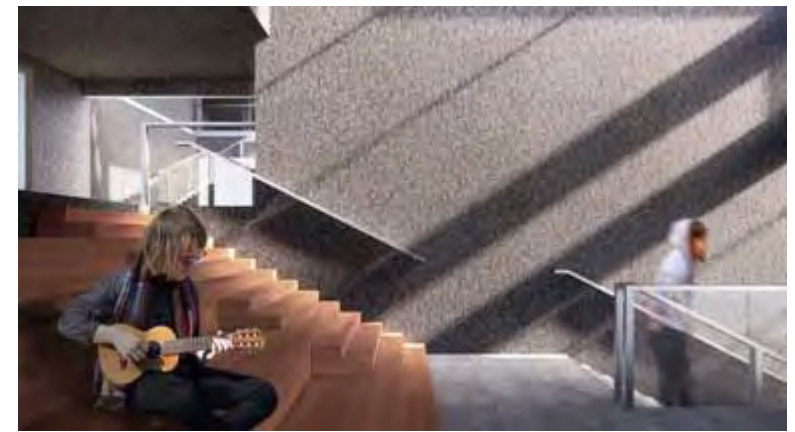

The stepped theater's main hall is parallel to the mountain.

The elaborative floor height of open rest area on one side of the main hall let the space extends outside.

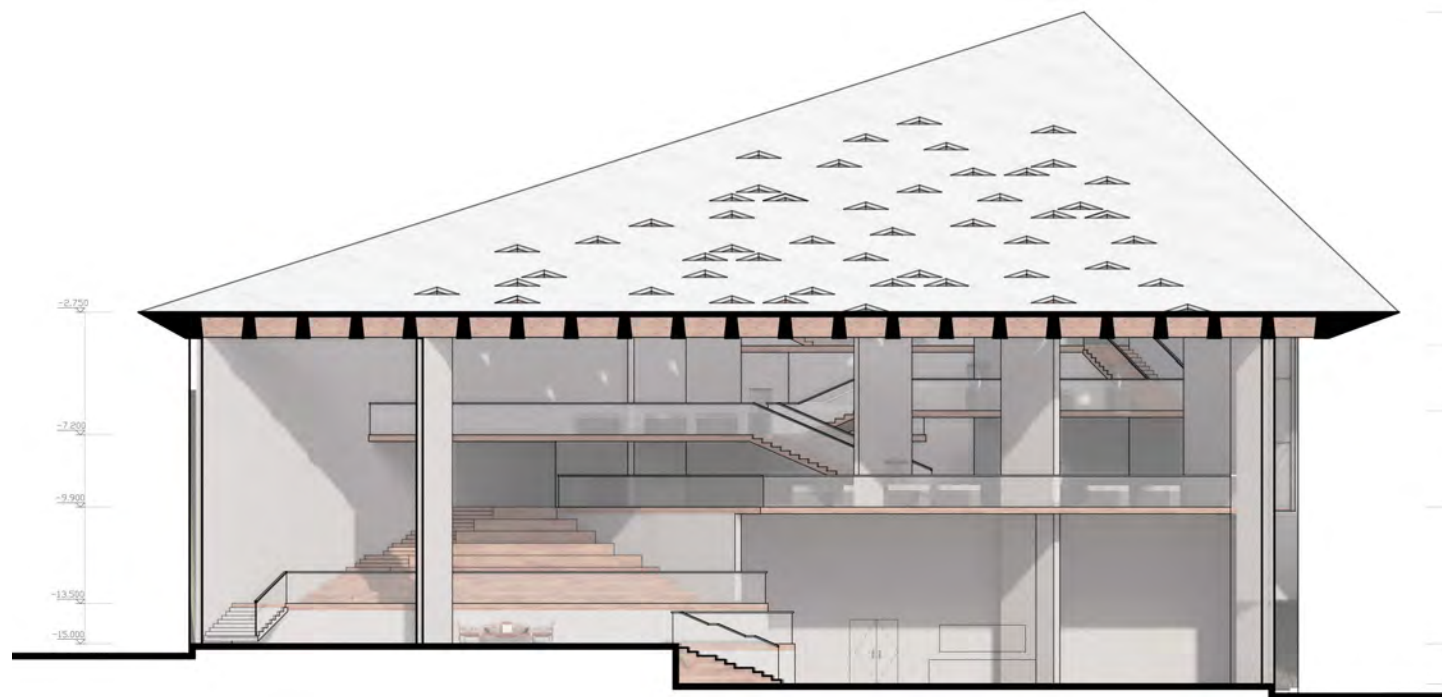

The restaurant with magnificent landscaping is located up the entrance, while the backstage space is hidden beneath the main hall.

The structure seems to be a mountain waterfall from the outside due to the cascading roof pool, and the pool is linked with Dongqian Lake from the inside, which shows harmony with surroundings.

the exhibition hall

The exhibition hall's "falling floor" idea mimics the sensation of a floating floor supported by an inside wall.

The exhibition hall is designed in the style of an observation tube, offering a panoramic view of Dongqian Lake and the opposite shore.

The light floor slab descends the mountain layer by layer, guided by the triangle grid.

During the course of seeing the show, the space and field of vision expand. At the same time, people can leave and return to the outdoor public activity space at any time.

To accomplish this spatial impact, a wooden truss with a triangular grid and a load-bearing wall with unique angle control are employed in the construction to enhance the inside space while not blocking the landscape.
